.....

The Novus Timing Network (NTN) allows a complex timing system to be linked to a single central timing source without the addition of additional cabling. The system consists of a single PTP time server and as many references required. The required frequency/timing references can be located throughout a given facility. The NTN references are attached to the existing facility IT network. The references acquire timing information from the PTP network and discipline the reference to the PTP timing information. The result is simplified installation. No need to install coaxial cables, no loss of noise performance or timing accuracy. A fully synchronized system that is easily incorporated into an existing facility.
